

Is Test-Enhanced Learning Able to Support Complex Cognitive Skill Retention in Fixed Tasks, Dual Tasks and Decision-Making Tasks?

Barbara Frank
Merle Lau
Annette Kluge

Complex cognitive skills (Van Merriënboer, 1997)

- Complex cognitive skills can be learned based on standard operating procedures (SOP) (Wickens & Hollands, 2000)
- Such complex tasks in non-routine situations can consist of e.g. fixed, sequential tasks or parallel tasks:
 - In fixed, sequential tasks the operators need to figure out first what kind of task has to be executed (e.g. start-up of a plant or error management) and then execute the initial learned standard operating procedures sequentially (Kluge, 2014)

Testing-effect and complex cognitive skills

Testing effect is explained by (Bjork & Bjork, 1992; Roediger & Karpicke, 2006)

- 1) the *intense retrieval* effort that learners have to invest in the testing situation to retrieve information from long-term memory
- 2) a *transfer enhancing processing* of information which is identical in the refresher situation and the later retention assessment (RA) situation

- Testing effect has been shown for simple task (e.g. word lists) (e.g., Carpenter et al., 2006; Carpenter et al., 2008; Karpicke & Roediger 2007, 2008)
- Little research for testing effect and complex tasks (Rawson, 2015; Kluge & Frank, 2014)
- Existing research is **inconsistent**

Testing is effective for complex material (e.g. Karpicke & Aue, 2015)

Testing is *not* effective for complex material (e.g. Leahy, Hanham & Sweller, 2015; van Gog & Sweller, 2015; van Gog, Kester, Dirks, Hoogerheide, Boerboom, & Verkoeijen, 2015)

Complex tasks

Complex tasks in non-routine situations can consist of e.g. fixed, sequential tasks or parallel tasks:

Fixed sequence task

- Operators first need to learn a sequence of tasks to be executed (e.g. start-up of a plant or error handling) and then they can execute the initially learned standard operating procedure (Proctor & Dutta, 1995; Wickens, 2014)

$$S1 \rightarrow A \rightarrow B$$

Parallel sequence task

- Parallel-sequence tasks basically consist of two sequences which have to be synchronised in time (Proctor & Dutta, 1995; Wickens, & McCarley, 2008; Wickens, 2008). In these tasks e.g. the operator has to execute a first task, and both tasks are executed simultaneously, directed attention allocation and time-sharing are required (Schumacher et al., 2001) An example of such a task is when a pilot is controlling different instruments during take-off, and consequently has to divide his/her attention according to change frequency and how valuable and costly the attention is (Moray, 1986)

$$S1 \rightarrow A1 \text{ AND } A2 \rightarrow B$$

Contingent sequence task

- Dynamic decision making can be defined by multiple, interdependent and real-time decisions, occurring in a dynamic environment, decisions under uncertainty take place, and the consequences and the task under uncertainty are interdependent (Moray, 1986). A contingent-sequence task is a task in which at a special point or under a special condition, the operator has to perform the next steps based on a correct gathering of information and interpretation of the situation.

$$S1 = X \rightarrow A_x \rightarrow B$$

OR

$$S1 = Y \rightarrow A_y \rightarrow B$$

Question

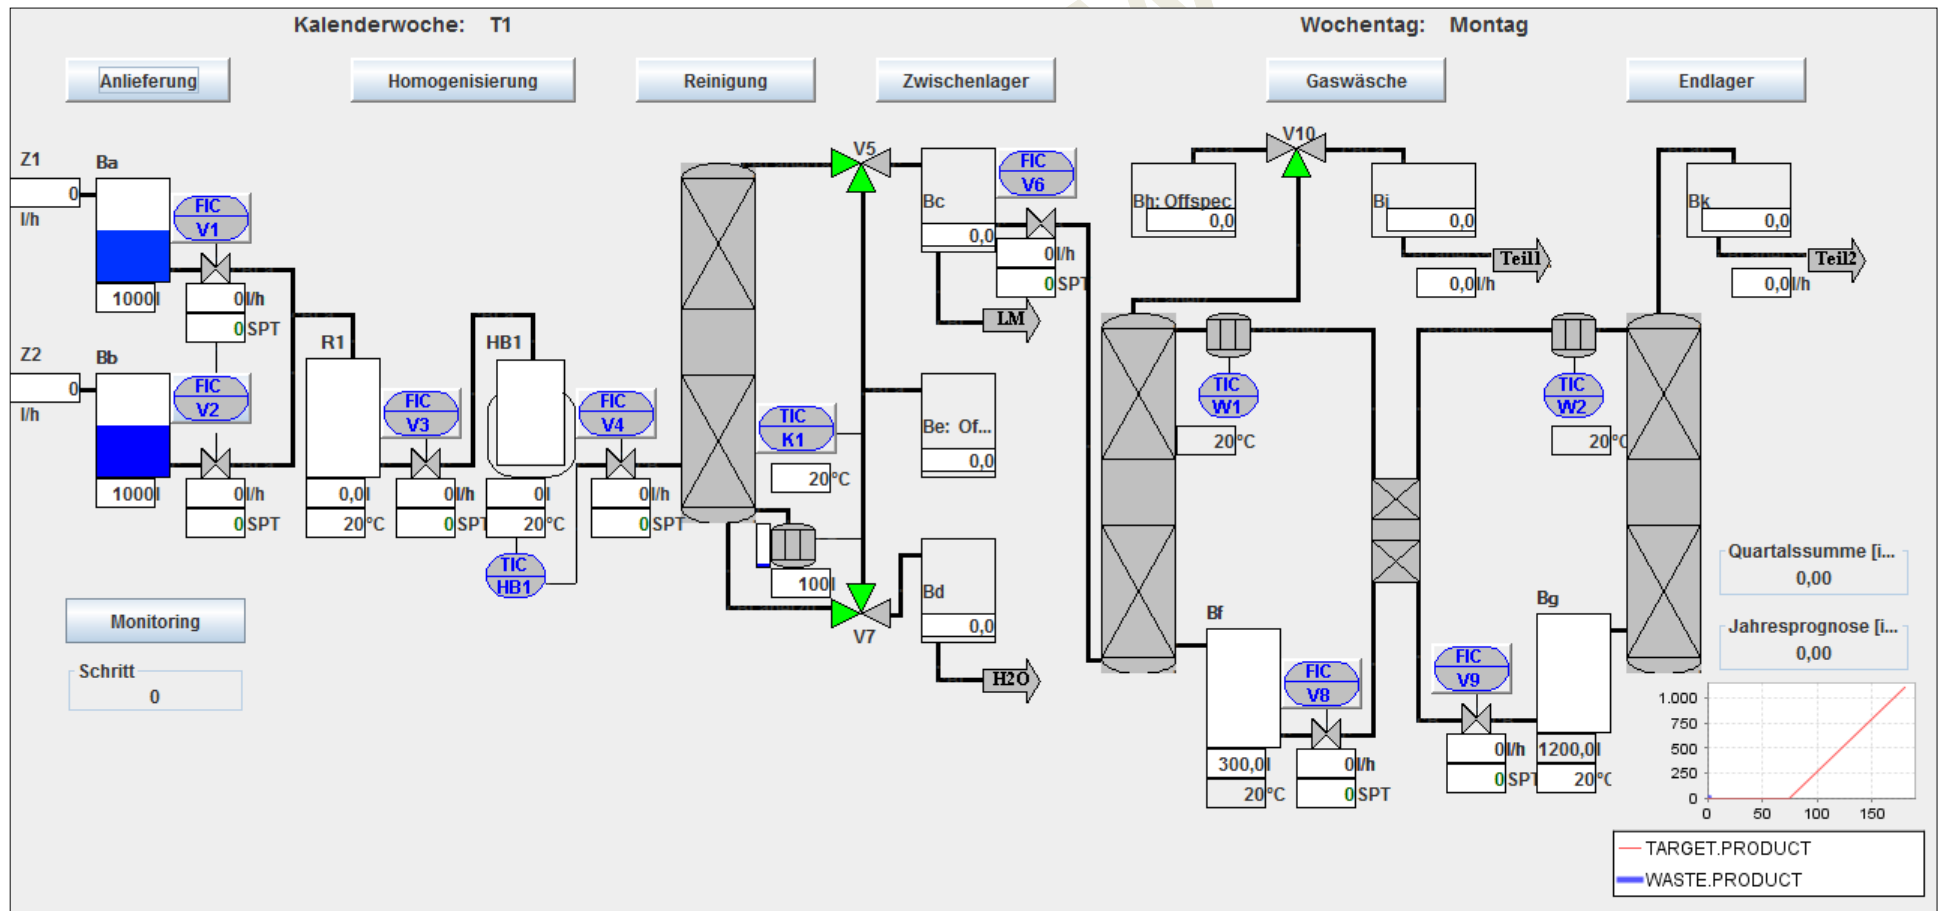

- ▶ Testing as a refresher intervention supports skill retention better than practice or no intervention for all three task-types

Hypothesis for Experiment 1, 2 & 3

- H1 Testing supports performance better than no intervention
- H2 Testing supports performance better than a practice (relearning) refresher intervention

Method: Waste Water Treatment Simulation

Process control task: Separate waste water into water and gas

Method: Waste Water Treatment Simulation

Process control task: Separate waste water into water and gas

Experiment 1 Fixed Sequence Task

- 1 LIC V9: Durchfluss 500 l/h
• Sollwert 500 l/h einstellen
• 2x Bestätigen mit „OK“
- 2 V2 Folgeregelung deaktivieren
• Regler V2 bedienen
• von extern auf intern stellen
• Bestätigen mit „OK“
- 3 Ventil V1: Durchfluss 500 l/h
• Sollwert 500 l/h einstellen
• 2x Bestätigen mit „OK“
- 4 Warten bis Inhalt R1 > 200l
- 5 Ventil V2: Durchfluss 500 l/h
• Sollwert 500 l/h einstellen
• 2x Bestätigen mit „OK“
- 6 Warten bis Inhalt R1 > 400l
- 7 Ventil V3: Durchfluss 1000 l/h
• Sollwert 1000 l/h einstellen
• 2x Bestätigen mit „OK“
- 8 Warten bis Inhalt Tank HB1 > 100l
- 9 Heizung HB1 einschalten
• von Hand auf Automatik stellen
• Bestätigen mit „OK“
- 10 Warten bis Inhalt Heizung HB1 > 60°C
- 11 Kolonne K1 in Betrieb nehmen
• von Hand auf Automatik stellen
• Bestätigen mit „OK“
- 12 Ventil V4: Durchfluss 1000 l/h
• Sollwert 1000 l/h einstellen
• 2x Bestätigen mit „OK“
- 13 Ventil V6: Durchfluss 400 l/h
• Sollwert 400 l/h einstellen
• 2x Bestätigen mit „OK“

Start-up in 180 sec

Experiment 2 Parallel Sequence Task

- 1 LIC V9: Durchfluss 500 l/h
• Sollwert 500 l/h einstellen
• 2x Bestätigen mit „OK“
- 2 Folgeregelung deaktivieren
• Regler V2 bedienen
• von extern auf intern stellen
• Bestätigen mit „OK“
- 3 Ventil V1: Durchfluss 500 l/h
• Sollwert 500 l/h einstellen
• 2x Bestätigen mit „OK“
- 4 Warten bis Inhalt R1 > 200l
- 5 Ventil V2: Durchfluss 500 l/h
• Sollwert 500 l/h einstellen
• 2x Bestätigen mit „OK“
- 6 Warten bis Inhalt R1 > 400l
- 7 Ventil V3: Durchfluss 1000 l/h
• Sollwert 1000 l/h einstellen
• 2x Bestätigen mit „OK“
- 8 Warten bis Inhalt Tank HB1 > 100l
- 9 Heizung HB1 einschalten
• von Hand auf Automatik stellen
• Bestätigen mit „OK“
- 10 Warten bis Inhalt Heizung HB1 > 60°C
- 11 Kolonne K1 in Betrieb nehmen
• von Hand auf Automatik stellen
• Bestätigen mit „OK“
- 12 Ventil V4: Durchfluss 1000 l/h
• Sollwert 1000 l/h einstellen
• 2x Bestätigen mit „OK“
- 13 Ventil V6: Durchfluss 400 l/h
• Sollwert 400 l/h einstellen
• 2x Bestätigen mit „OK“

Start-up in 240 sec

Experiment 3 Contingent Sequence Task

- 1 LIC V9: Durchfluss 500 l/h
• Sollwert 500 l/h einstellen
• 2x Bestätigen mit „OK“
- 2 V2 Folgeregelung deaktivieren
• extern auf intern stellen
• Bestätigen mit „OK“
- 3 Ventil V1: Durchfluss 500 l/h
• Sollwert 500 l/h einstellen
• 2x Bestätigen mit „OK“
- 4 Warten bis Inhalt R1 > 200l
- 5 Ventil V2: Durchfluss 500 l/h
• Sollwert 500 l/h einstellen
• 2x Bestätigen mit „OK“
- 6 Warten bis Inhalt R1 > 400l
- 7 Ventil V3: Durchfluss 1000 l/h
• Sollwert 1000 l/h einstellen
• 2x Bestätigen mit „OK“
- 8 Warten bis Inhalt Tank HB1 > 100l
- 9 Heizung HB1 einschalten
• von Hand auf Automatik stellen
• Bestätigen mit „OK“
- 10 Warten bis Inhalt Heizung HB1 > 60°C
- 11 Kolonne K1 in Betrieb nehmen
• von Hand auf Automatik stellen
• Bestätigen mit „OK“
- 12 Ventil V4: Durchfluss 1000 l/h
• Sollwert 1000 l/h einstellen
• 2x Bestätigen mit „OK“
- 13 Ventil V6: Durchfluss 400 l/h
• Sollwert 400 l/h einstellen
• 2x Bestätigen mit „OK“
- 14 Einschätzung der folgenden Schritte abhängig von Parametern:
W1 > 15°C W2 < 70°C
- 15 LIC V8 deaktivieren
LIC V8 extern auf intern Bestätigen mit „OK“
- 16 LIC V9: Durchfluss 700 l/h
Sollwert 700 l/h einstellen
2x Bestätigen mit „OK“
- 17 LIC V8: Durchfluss 500 l/h
Sollwert 500 l/h einstellen
2x Bestätigen mit „OK“
- 18 Heizung W1 auf 15 °C
Sollwert 15 °C einstellen
2x Bestätigen mit „OK“
- 15 LIC V8 deaktivieren
LIC V8 extern auf intern Bestätigen mit „OK“
- 16 LIC V9: Durchfluss 600 l/h
Sollwert 600 l/h einstellen
2x Bestätigen mit „OK“
- 17 LIC V8: Durchfluss 400 l/h
Sollwert 400 l/h einstellen
2x Bestätigen mit „OK“
- 18 Heizung W2 auf 70 °C
Sollwert 70 °C einstellen
2x Bestätigen mit „OK“

Method Exp. 1-3: Participants & Procedure

Participants

Experiment 1: Fix

N=57 (18 female)
Age: 21.88 (3.14, 18-31)

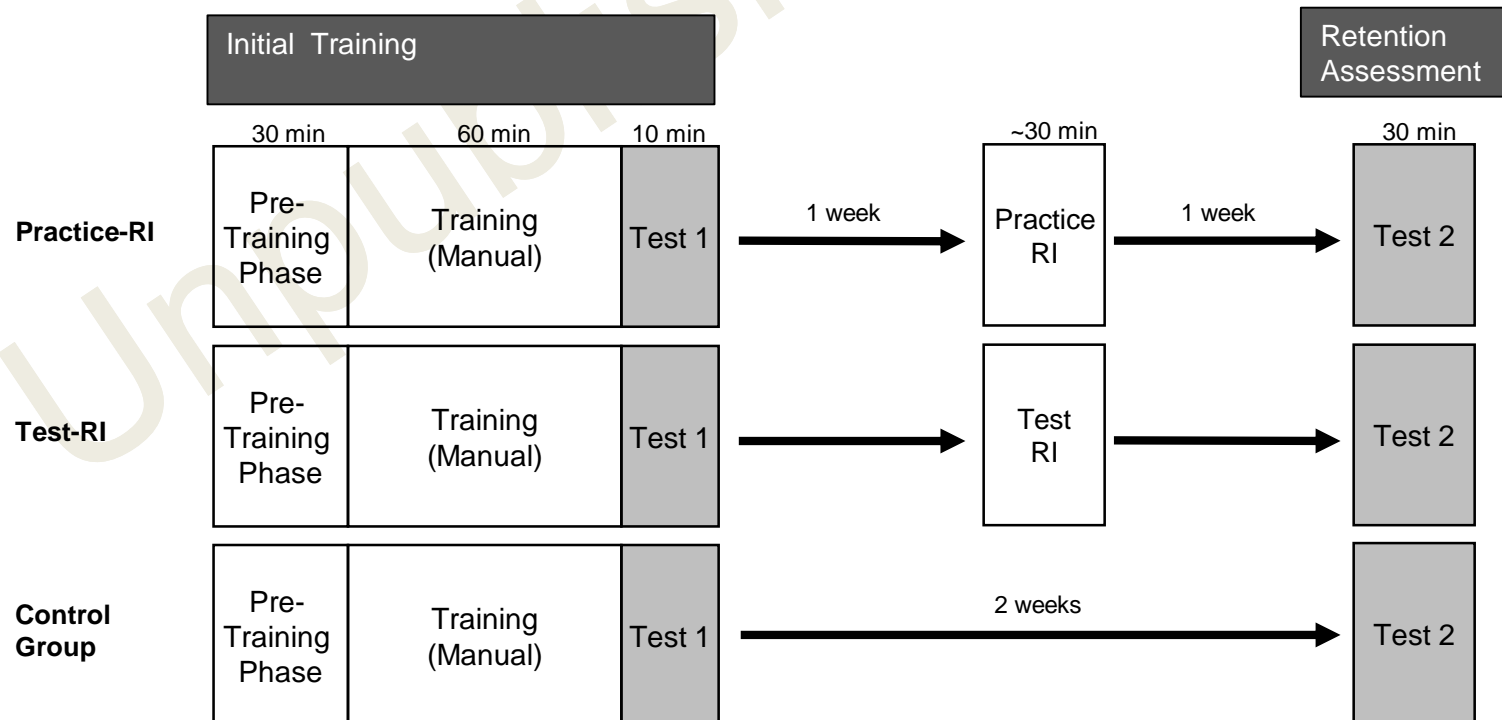

Experiment 2: Parallel

N=60 (16 female)
Age: 23.45 (3.57, 19-36)

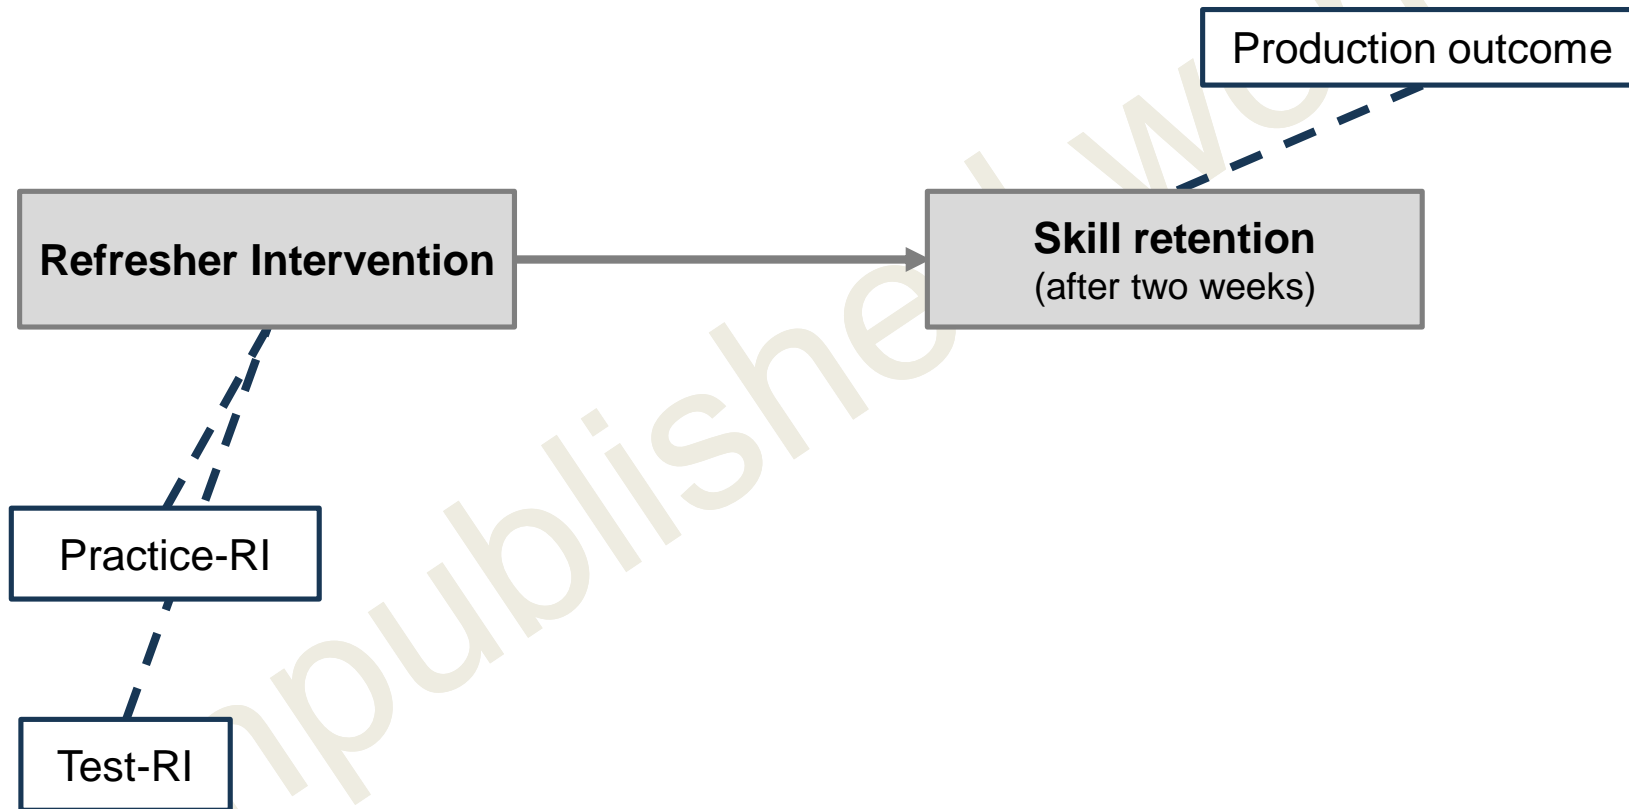

Experiment 3: Contingent

N=58 (22 female)
Age: 22.76 (3.11, 17-32)

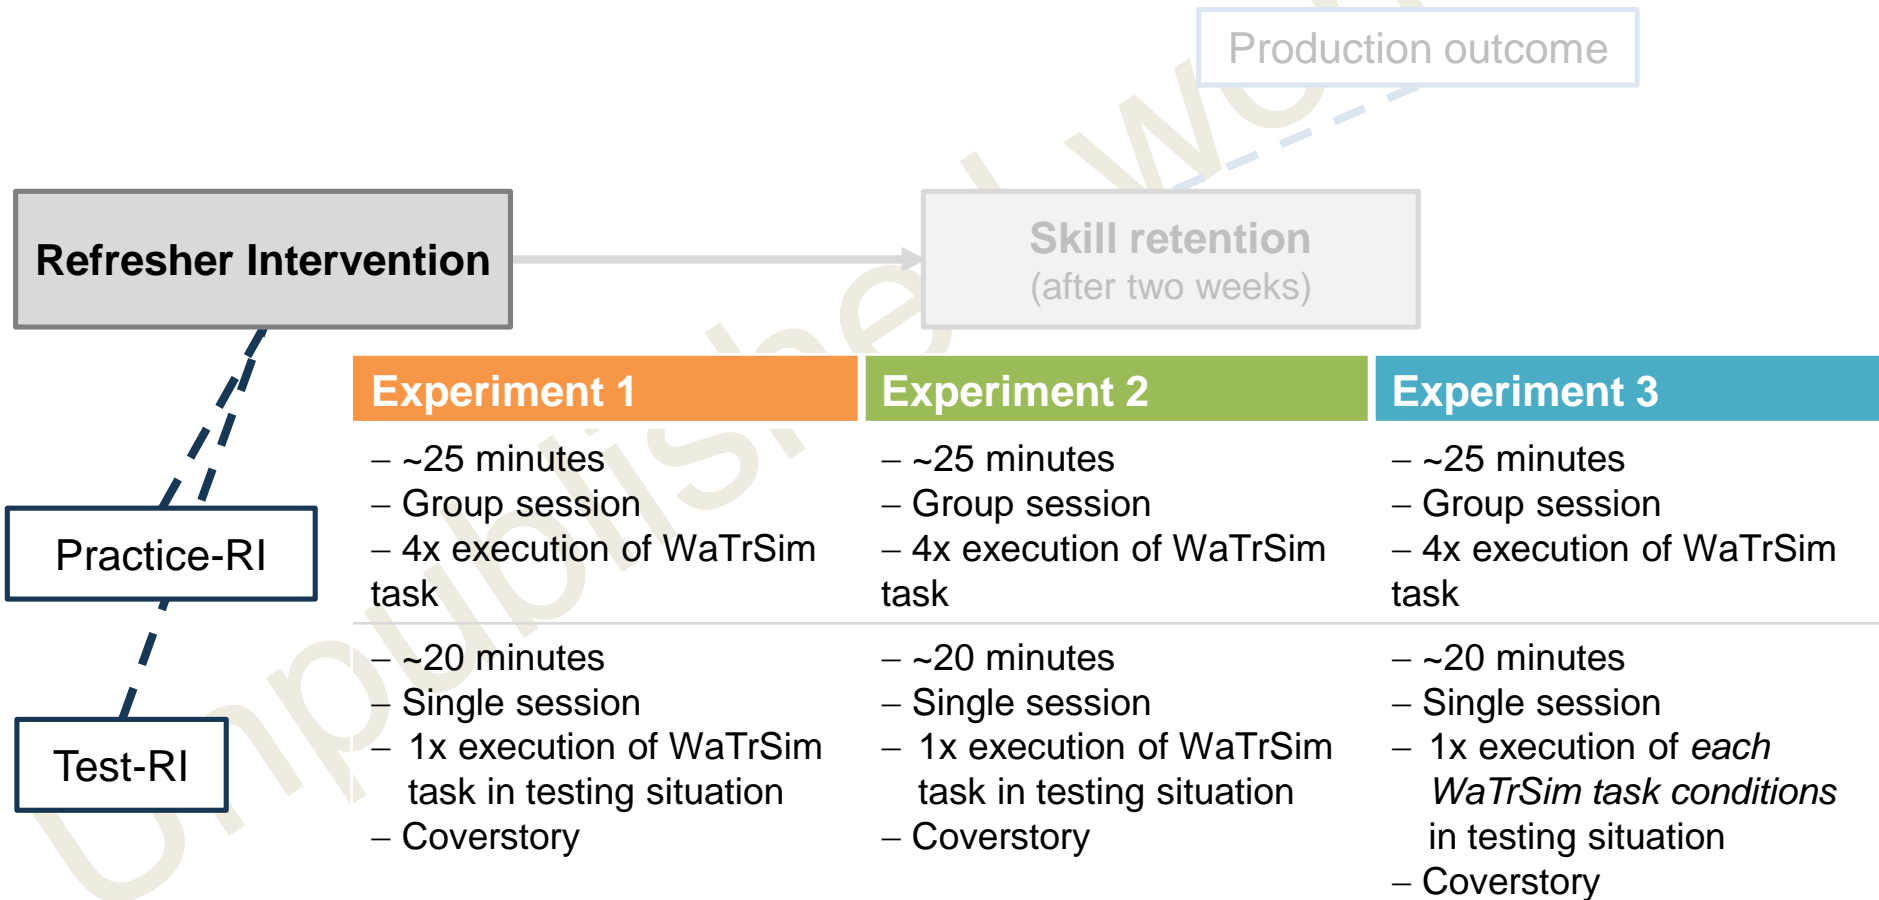

Procedure (Exp. 1-3)

Method Exp. 1-3: Variables

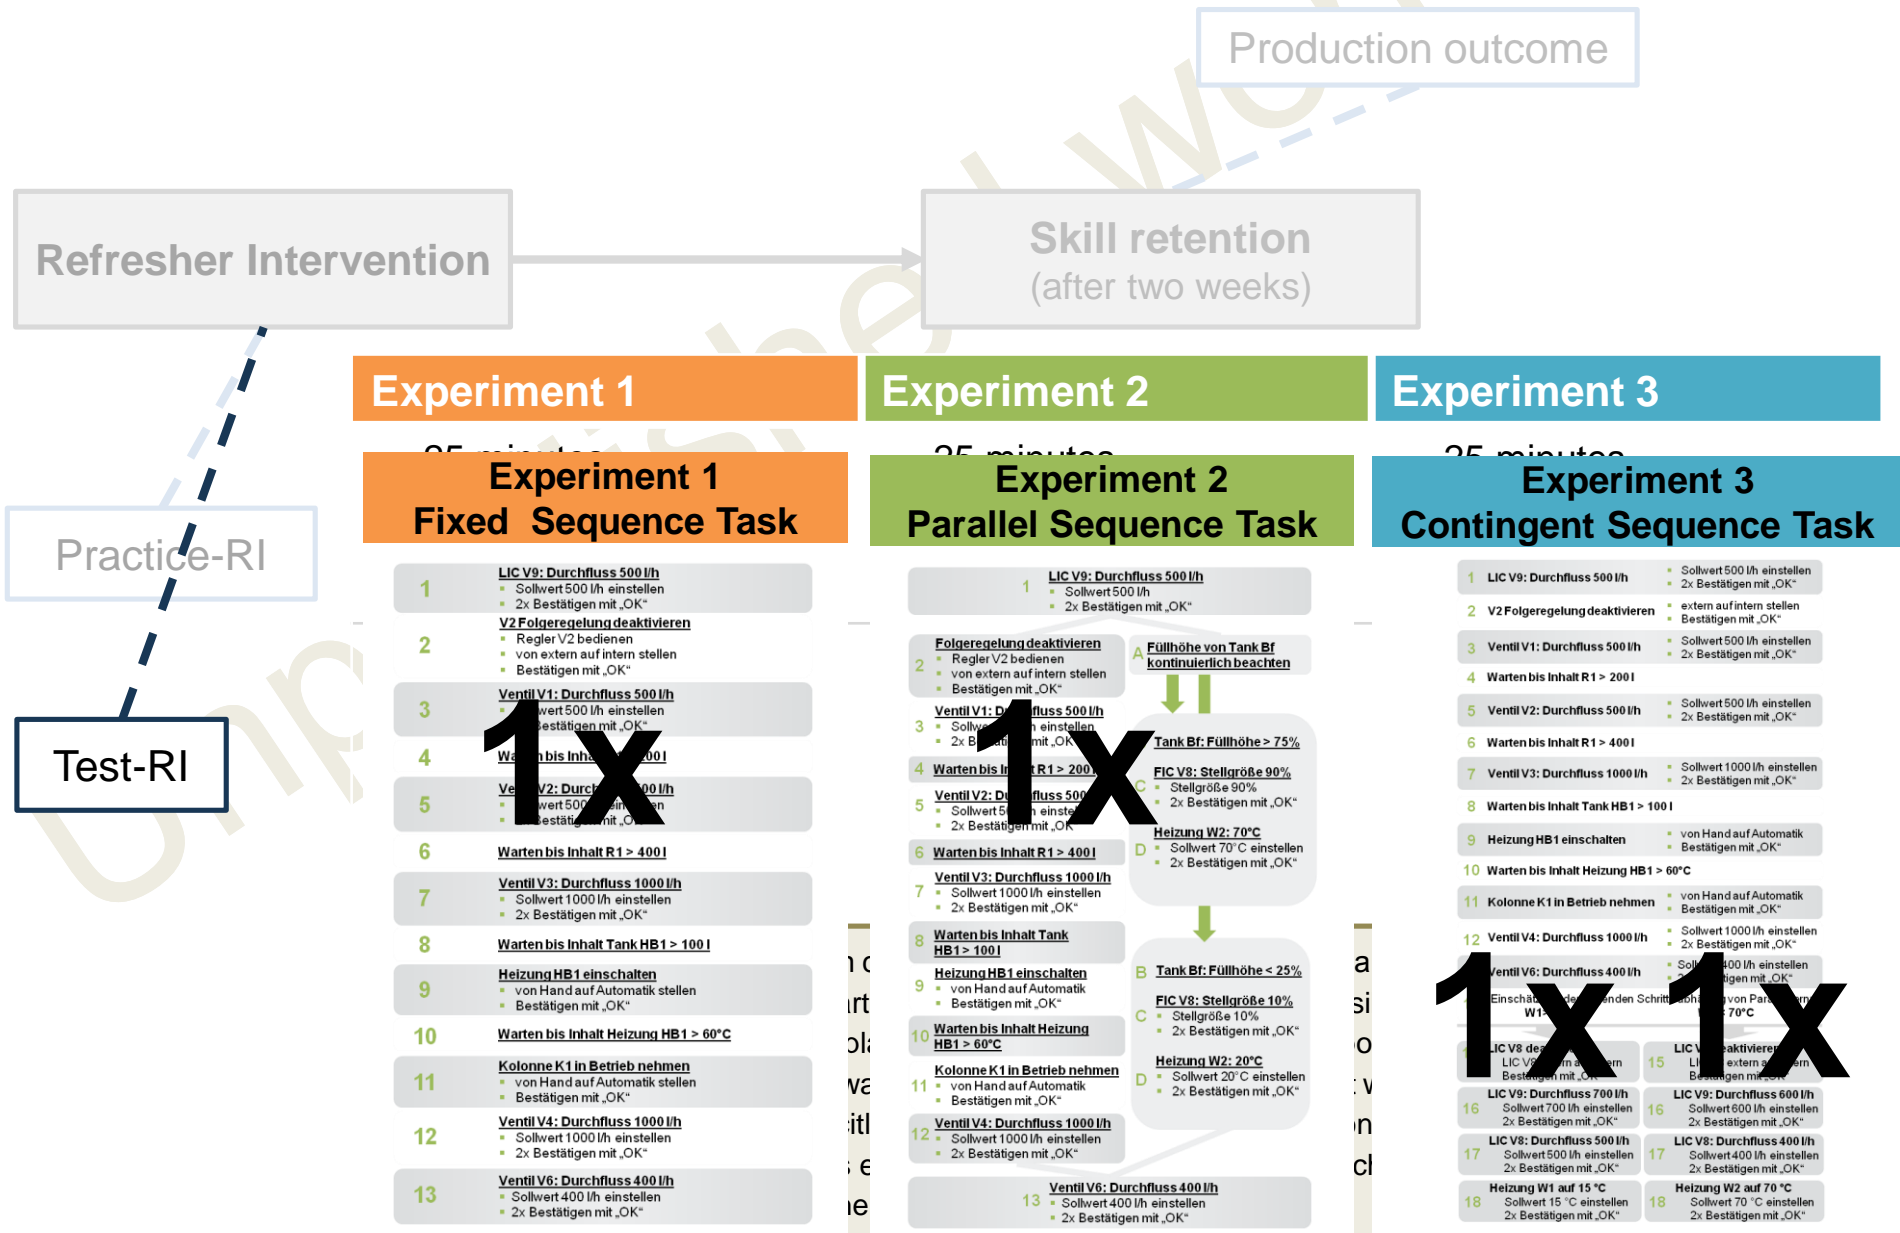

Method Exp. 1-3: Variables

Coverstory A small town called 'Feldkirchen' needs the participants' help. The participant was told that she/he is responsible to start-up the plant and produced as much water as possible to save the water supply. In addition, the participant was asked explicitly to concentrate and focus all attention on the task. It is emphasised that she/he has only one chance to start-up the procedure correctly.

Method Exp. 1-3: Variables

Experiment 1: Fixed sequence task

Results

Hypothesis 1

Testing > No intervention

- Effect of time
($F(1,36)=125.74$; $p<.001$; $n^2_p=.777$)
- Effect of group
($F(1,36)=2.98$; $p=.093$; $n^2_p=.076$)
- Interaction
($F(1,36)=0.38$, $p=.544$; $n^2_p=.010$)

Hypothesis 2

Testing > Practice Refresher Intervention

- Effect of time
($F(1,37)=57.83$; $p<.001$; $n^2_p=.610$)
- Effect of group
($F(1,37)=0.56$; $p=.458$; $n^2_p=.015$)
- **Interaction**
($F(1,37)=5.21$; $p=.028$; $n^2_p=.124$)

Production outcome*

* Amount of produced production outcome depends on task

Experiment 2: Parallel sequence task

Results

Hypothesis 1

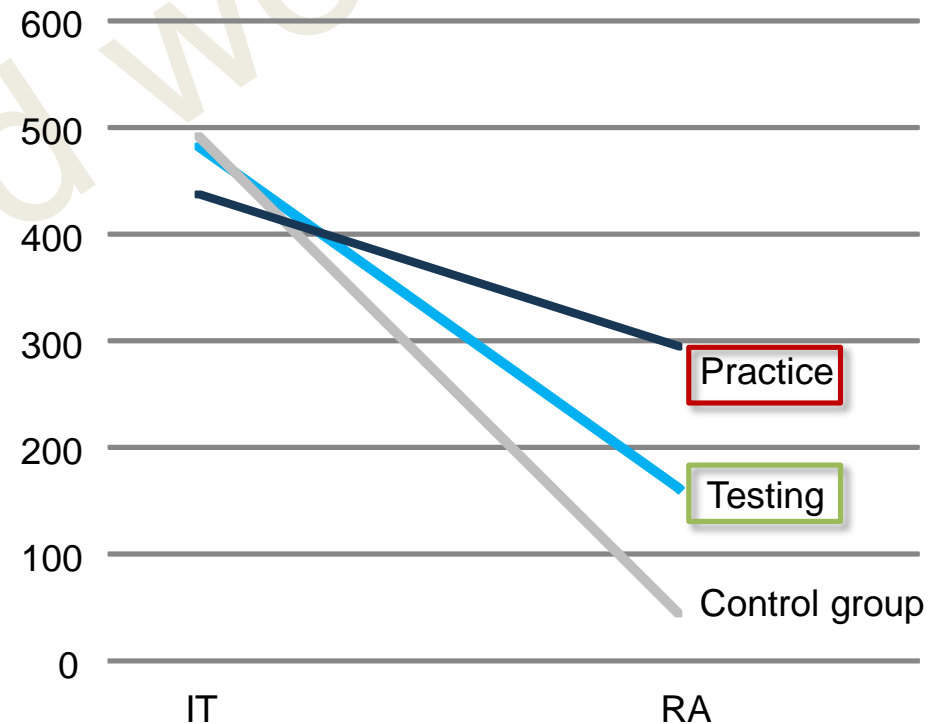

Testing > No intervention

- Effect of time
($F(1,38)=400.67$; $p<.001$; $n^2_p=.913$)
- Effect of group
($F(1,38)=3.83$; $p=.058$ $n^2_p=.091$)
- **Interaction**
($F(1,38)=10.53$, $p=.002$; $n^2_p=.217$)

Hypothesis 2

Testing > Practice Refresher Intervention

- Effect of time
($F(1,38)=83.80$; $p<.001$; $n^2_p=.688$)
- Effect of group
($F(1,38)=1.32$; $p=.258$; $n^2_p=.034$)
- **Interaction**
($F(1,38)=12.68$; $p=.001$; $n^2_p=.250$)

Production outcome*

* Amount of produced production outcome depends on task

Experiment 3: Contingent sequence task

Results

Hypothesis 1

Testing > No intervention

- Effect of time
($F(1,36)=100.80$; $p<.001$; $\eta^2_p=.737$)
- Effect of group
($F(1,36)=4.85$; $p=.034$; $\eta^2_p=.119$)
- **Interaction**
($F(1,36)=4.36$; $p=.044$; $\eta^2_p=.108$)

Hypothesis 2

Testing > Practice Refresher Intervention

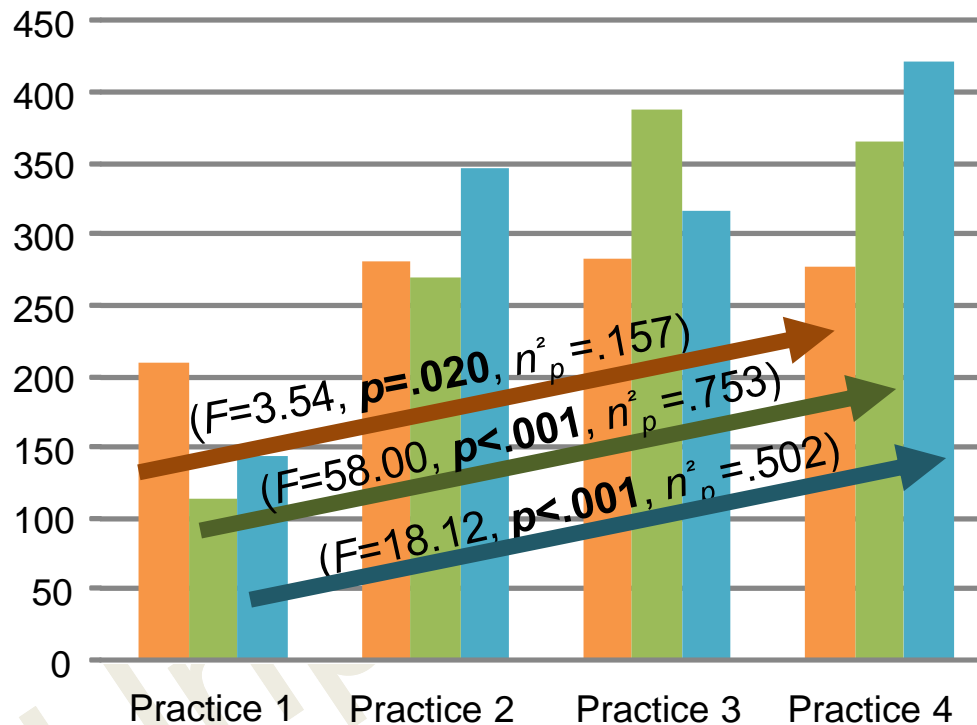

- Effect of time
($F(1,37)=76.54$; $p<.001$; $\eta^2_p=.674$)
- Effect of group
($F(1,37)=1.19$; $p=.283$; $\eta^2_p=.031$)
- Interaction
($F(1,37)=0.18$; $p=.677$; $\eta^2_p=.005$)

Production outcome*

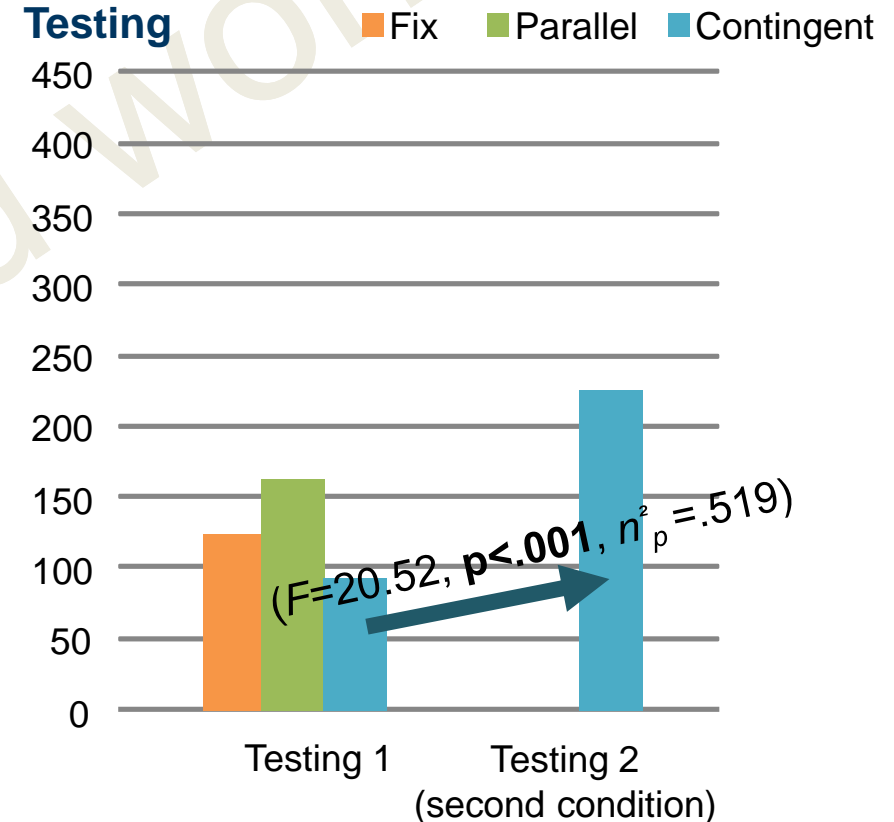

* Amount of produced production outcome depends on task

Post-hoc: What is the benefit of Practice?

Practice Trial 1 to Practice Trial 4

Testing

- Rehearsal Practice supports learning
- Testing of two different conditions supports also learning

Discussion

- Testing effect for complex cognitive skills was not shown
 - Fixed sequence task: Practice > Testing
 - Parallel sequence task: Practice > Testing
 - Contingent sequence task: Practice = Testing
- Testing was not able to support skill retention of the complex tasks
- Rehearsal practice supports learning and understanding of complex tasks that require a precise execution in a predefined time
- Two testings in a row support also learning
 - Testing trials that differ in difficulty might induce an added value (Brown, Roediger, & McDaniel, 2014)
- Two consecutive testings have a similar effect as Practice

Practice > Testing

Thank you for your attention 😊
